Feedback

Marker 1

Throughout his studies, as well as his thesis report, code and demo, the student has shown to have gained the skills related to his project (i.e., blockchains and DeFi), as well as the knowledge of their studies at LU (i.e., analytical skills and coding). The student has done a thorough reading related to his work, as demonstrated by the background and literature review in his report. The student has enough to justify the methodology and tools used in his project. The analysis and planning are reasonable and well implemented. The project was implemented well with the implementation, testing and evaluation all carried out at a high quality level. General: In general, the project is implemented well with most functionalities fully realized. The final report is written good with the reasonable level of justification of the methodology, selected tools and design features. The report also has some mathematical part with computations of the values/rates in DeFi applications. The code and demo support the good impression made by the student during his studies. The only minor issue with the work is that it is very much focused on coding and does not contain any math modeling part. Apart from this, the project is done well.

Marker 2

The student shows excellent understanding background knowledge. The student understand the proposed area well and shows full level of planning. The proposed project has shown excellent full design process with clear implementation, testing and evaluation. Good thesis writing with clear structure. General: This project successfully developed a decentralised Ethereum blockchain application platform that allows users to choose between a fixed or floating interest rate. The report is written and presented reasonably well with clear structure. It would be better to add aims & objective and original contributions subsections in Chapter 1 and present more about any similar existing application platform available at the moment plus comparison study.
